

Configuration Management Plan

ALRP Production Baseline

Prepared by: Change Advisory Board

Baseline: NIST SP 800-53 Rev. 5 -- Moderate

Classification: Controlled Unclassified Information (CUI)

Status: Draft for pre-adjudication review

1. Plan Purpose

The Configuration Management Plan governs how the secure baseline of the ALRP is established, documented, and maintained. It defines the change-control process, the inventory of record, and the mechanisms that detect and reconcile drift.

2. Baseline Definition

The production baseline is expressed as version-pinned infrastructure-as-code together with hardened component images. The baseline is the authoritative definition of the approved configuration state.

3. Control Implementations

CM-3 Configuration Change Control

Configuration change control prevents unauthorized or unreviewed modifications from degrading the security baseline.

Proposed configuration changes are reviewed and dispositioned by the Change Advisory Board weekly.

Each change carries a documented justification, rollback plan, and security impact analysis before approval.

CM-8 System Component Inventory

An accurate component inventory is the foundation for vulnerability management, license control, and incident scoping.

The authoritative system inventory is reconciled monthly against the assets discovered on the network.

Discovery data is collected automatically and reconciled against the authoritative inventory of record.

CP-9 System Backup

System backup protects the availability of data and configuration against corruption, ransomware, and hardware loss.

Backup restoration is tested quarterly into an isolated recovery environment to confirm recoverability.

Backups are encrypted, replicated across regions, and protected against deletion before their retention expires.

RA-5 Vulnerability Monitoring and Scanning

Vulnerability scanning identifies exploitable weaknesses before an adversary can leverage them.

Authenticated vulnerability scans are executed quarterly across every asset inside the authorization boundary.

Scan results are risk-ranked and remediated within timelines keyed to severity, with exceptions formally accepted.

4. Supporting Controls

CM-2 Baseline Configuration

A current, documented baseline configuration is maintained as the authoritative reference for the approved state of the system.

CM-6 Configuration Settings

Mandatory configuration settings are established from hardening benchmarks and enforced through automated configuration management.
